

ROCKY SHORE FOOD WEB

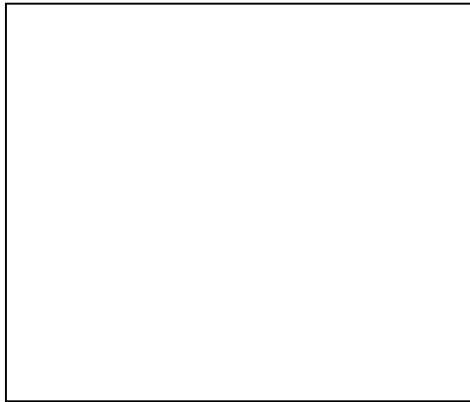

Create a food web! Choose and draw four marine animals from the rocky shore tank and draw lines between them showing what eats what (energy flows)! Can you guess whether your organisms are carnivores, omnivores, herbivores or decomposers / scavengers?

Carnivores = meat eaters

Herbivores = vegetable eaters

Omnivores = eats both meat and vegetables

Decomposers/scavengers = eats what is rotting on the bottom

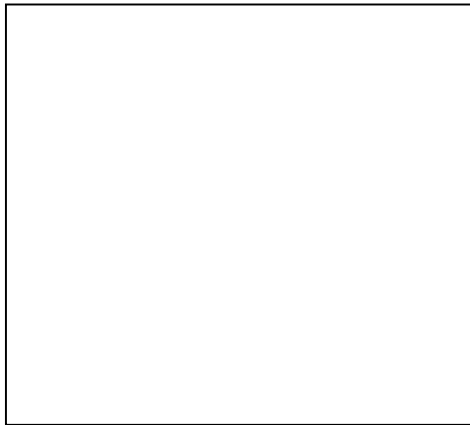

Rocky Shore Animals

Life on the rocky shore is not easy. Animals living on the rocky shore have adaptations to cope with **changes in temperature, lack of water and dissolved oxygen, salinity fluctuations, wave action, terrestrial predators and competition.**

Select two animals from the Rocky Shore exhibit and sketch them in the boxes below. Think about the environmental conditions they face and describe what adaptations they have to survive these conditions.
